

Position on the Use of Generative Artificial Intelligence (AI)

Position Statement

Cardiff Metropolitan University recognises the profound impact that Generative Artificial Intelligence (AI) is having across education, research, industry, and society. We recognise the huge potential benefits AI may bring, and we also acknowledge the potential risks and concerns being expressed around different facets of the technology. As an ambitious and progressive modern University, we are committed to engaging with AI tools in a way that is forward-looking, ethically responsible, and aligned with our core mission and values.

Our Approach

We take a positive and principle-based stance on the integration of AI into our learning, teaching, research and operational practices. AI offers considerable potential to enhance the student experience, student employability, enable personalised learning, support researcher activities, and increase efficiency in administrative and academic tasks.

We believe that AI tools, when used thoughtfully and ethically, can empower our students and staff, offering new avenues for exploration, creativity, and the optimisation of academic processes. However, we are acutely aware of the considerations that accompany these powerful technologies, most notably the paramount importance of academic integrity and rigour.

To navigate this evolving landscape, we are committed to promoting literacy around AI technology across both our students and our staff and fostering a culture of its responsible use among all members of our community. This involves providing clear guidance on when and how AI tools can and cannot be leveraged to support learning and work, while emphasising the critical need for original thought, critical evaluation of AI-generated content, and transparent attribution where AI has been utilised.

Moving Forward

As AI technologies continue to advance, we will remain actively engaged in the development of comprehensive policies and guidance that will ensure the ethical, fair, and effective integration of AI across all aspects of university life. These policies will address areas such as appropriate use in coursework and research, data privacy, and the cultivation of AI literacy skills for all.

Our commitment to our community is to harness the benefits of AI to enrich the educational experience, advance knowledge, and prepare our community for the future, all while upholding the highest standards of academic honesty and rigor.

We invite open dialogue across the university community to help continually shape our collective response and to ensure that AI serves as an ongoing tool for empowerment.
